

Is the change in the total revenue for ticker symbol PNC and WFC are similar over the years ?

The company's revenue depends on many variables like expenditure ,R&D, cost of good sold , sales, administration expenses. By seeing the visualization, we can say that total revenue for both ticker symbol PNC and WFC are positively skewed. It means the mean > median. The positive skewness of a distribution indicates that the company may expect frequent small losses and a few large gains from the investment. The positively skewed distributions of investment returns are generally more desirable by companies since there is some probability to gain huge profits that can cover all the frequent small losses.

The mean, median and standard deviation of the WFC is more than the mean, median and standard deviation of the PNC. This means WFC is showing more profit and expenditure compared to PNC. PNC may have more frequent losses compared to WFC, but both may have profits in the coming years.
